Functional Requirements by Tazim(T):

User story - Add to cart, Remove From cart, Wishlist.

1. **Add to cart:**
   When a user/buyer want to buy something from our website then he/she add this product to the card by clicking “Add to cart” button. After clicking “Add to cart” button number over the cart icon that is in navbar is increasing. While clicking this cart icon user can see all his product that are added by him. Cart is like a bucket . You can assume selected product are added to the bucket and finally add the items into the bucket are ready to payment.

   Success:
   1. Product are added to the cart .
   2. List of product are shown into the cart if user added more than one product.
   3. Total price of the products are shown below .
   4. There is a button named checkout is shown . Checkout is used for payment .

   Failure:

   1. No internet connection
   2. Product stock out

2. **Remove From Cart :**
   If some product are added with unconscious mind then user can remove product from cart . For this there is a remove button for removing product form add to cart.

   Success:
   1. Product removed from cart successfully.
   2. Total amount is decreased.
   3. Total number of items are decreased.

Failure:

1. Can’t remove product because of failure of internet connection
2. Can’t remove product from cart because of some coding issue may happened.

3.Add product to wish list:

User can save their interested product to the whish list this signifying interest without immediate intent to purchase . They can see their interested product later by checking wish list and also purchase product further from wish list.

Success:

1. Add product to whish list successfully.
2. See all items added to the whish list.

Failure:

1. Poor internet connection .
